

Python Programming Internship – Task 2

Task Description

In Task-1, you practiced Python basics and solved small coding challenges. Now, it's time to **apply Python in a real-world mini project: an Expense Tracker (Command-Line Application)**.

This project will teach you how to:

- **Take user input** (for expenses).
- **Save data** in a file (CSV format).
- **Read and display saved expenses**.
- Perform **basic calculations** (like total amount spent).

You'll be building your first simple but practical **Python application**.

What You'll Build (Requirements)

1. User should be able to:
 - Add an expense (description + amount).
 - View all expenses.
 - View total spent.
2. Store all data in a CSV file (`expenses.csv`).
3. Use Python functions to organize your code.

Why This Task Is Important

- You'll learn **file handling** (read/write files).
- You'll understand how to **structure Python programs** into functions.
- This simulates real-world scenarios like expense management apps.

Deliverable

A Python CLI Expense Tracker that can add, display, and calculate expenses.

Sample Starter Code

python

```
import csv

def add_expense(desc, amount):
    with open("expenses.csv", "a", newline="") as f:
        writer = csv.writer(f)
        writer.writerow([desc, amount])

def view_expenses():
    with open("expenses.csv", "r") as f:
        for row in csv.reader(f):
            print(f"Item: {row[0]}, Amount: ₹{row[1]}")

def total_expenses():
    total = 0
    with open("expenses.csv", "r") as f:
        for row in csv.reader(f):
            total += int(row[1])
    print("Total Expenses: ₹", total)

# Example usage
add_expense("Coffee", 50)
add_expense("Snacks", 100)
view_expenses()
total_expenses()
```
